Target Information

Hemoglobin is a complex molecule composed of four subunits: two alpha globin chains and two beta globin chains. Each globin chain is bound to a heme group, which contains an iron atom at its center. The iron atom is what allows hemoglobin to bind to oxygen. Hemoglobin, beta is encoded by the *HBB* gene in sheep. Hb is the protein contained in red blood cells that is responsible for delivery of oxygen to the tissues. It is found in almost all vertebrates.
